CAPSTONE PROJECT

You should start working on your capstone project(s) and submit them whenever you are ready. This is an open-ended project that mostly captures every topic you've learned in the course of this program. The goal of-course is nothing but for you to demonstrate your understating of the covered material and most importantly, to demonstrate your technical ability in data science to future employers.

The more you invest in doing your project the more you stand to benefit. You are required to upload your project to your GitHub repository and submit the link to it here. You are required to write a comprehensive story about your project on medium and submit to the publication Data Insight. Finally, you are required to write a tutorial (in a blog) about a specific topic in data science (e.g how to scrape the web, or how to process images in python, etc) and submit for publication in Data Insight. Anything that a learner can read and be able to perform a specific task will suffice for the tutorial. For your capstone project(s), you may consider some ideas here. Of course, you are free to do any project(s) you deem fit.
